

# Package: kwb.CrowdWater (via r-universe)

June 14, 2026

**Title** Lake Indicators from CrowdWater Observations

**Version** 0.0.0.9000

**Description** This package uses observations data of lakes collected by the CrowdWater App to derive semi-quantitative indicators for nutrients (trophic state), biotope value, use of the lakes and water availability characteristics.

**License** MIT + file LICENSE

**URL** <https://github.com/KWB-R/kwb.CrowdWater>

**BugReports** <https://github.com/KWB-R/kwb.CrowdWater/issues>

**Encoding** UTF-8

**Roxygen** list(markdown = TRUE)

**RoxygenNote** 7.3.2

**Suggests** covr, htmltools

**Depends** R (>= 2.10)

**LazyData** true

**Imports** htmlwidgets, leaflet, leaflet.extras, magrittr

**Config/pak/sysreqs** libabsl-dev cmake libgdal-dev gdal-bin libgeos-dev make libicu-dev libpng-dev libuv1-dev libssl-dev libproj-dev libsqlite3-dev libudunits2-dev

**Repository** <https://kwb-r.r-universe.dev>

**Date/Publication** 2025-09-29 14:21:20 UTC

**RemoteUrl** <https://github.com/KWB-R/kwb.CrowdWater>

**RemoteRef** HEAD

## Index 18

---

add\_ObservationIndicators

*Add all the indicators to the lake properties table*

---

### Description

Add all the indicators to the lake properties table

### Usage

```
add_ObservationIndicators(df_cw)
```

### Arguments

df\_cw                      Dataframe of the CrowdWater lake properties, prepared by [prepare\\_data\(\)](#)

### Value

df\_cw extended by 4 indicator columns

---

assign\_points\_MC      *Assign Points of Multiple choice answer*

---

**Description**

Used within the indicator functions

**Usage**

```
assign_points_MC(df, property, categories, points, NA_answers = "No answer")
```

**Arguments**

df	Prepared CrowdWater data frame
property	Character Value. One of the column names of df
categories	Character vector that lists the categories of the property for which points are assigned
points	Numeric vector of the same length and order of the categories vector with the assigned points
NA_answers	Character vector defining one or more answers that are treated as NA values

**Value**

a list of

- points: Numeric vector of the category points
- valid\_answer: Logical vector if all the required properties were observed
- scoring\_system: The points assigned to the categories

---

assign\_points\_SC      *Assign Points of Single choice answer*

---

**Description**

Used within the indicator functions

**Usage**

```
assign_points_SC(df, property, categories, points, NA_answers = "No answer")
```

**Arguments**

df	Prepared CrowdWater data frame
property	Character Value. One of the column names of df
categories	Character vector that lists the categories of the property for which points are assigned
points	Numeric vector of the same length and order of the categories vector with the assigned points
NA_answers	Character vector defining one or more answers that are treated as NA values

**Value**

a list of

- points: Numeric vector of the category points
- valid\_answer: Logical vector if all the required properties were observed
- scoring\_system: The points assigned to the categories

---

base\_map

*the Basemap used for all leaflet maps*

---

**Description**

the Basemap used for all leaflet maps

**Usage**

```
base_map(
  longitude = 13.3987,
  latitude = 52.5048,
  zoom = 11,
  berlin_districts = TRUE
)
```

**Arguments**

longitude	Numeric value defining the longitude if WGS84
latitude	Numeric value defining the latitude if WGS84
zoom	The initial and minimum zoom level
berlin_districts	Logical value if berlin districts should be added

**Value**

A leaflet map

---

bboxes	<i>Regions Bounding Boxes</i>
--------	-------------------------------

---

**Description**

Regions Bounding Boxes

**Usage**

bboxes

**Format**

A named list of regions defined by bounding boxes. The bounding boxes are numeric vectors of coordinates which define the top, bottom, left, and right coordinates of the box.(in WGS84)

---

berlin_district_shp	<i>Simple feature of the Berlin district boundaries</i>
---------------------	---

---

**Description**

Simple feature of the Berlin district boundaries

**Usage**

berlin\_district\_shp

**Format**

Besides the geometry, the Name of the district and its ID is given

---

categories_sum	<i>This function returns the sum of categories per property of the given dataframe</i>
----------------	--

---

**Description**

This function returns the sum of categories per property of the given dataframe

**Usage**

```
categories_sum(df, property, language = "english", includeNA = FALSE)
```

**Arguments**

df	Dataframe of the crowdwater lake properties prepared by <code>prepare_data()</code> , optionally filtered for one ROOT_ID
property	The property
language	A character string, defining the language of df. If unknown the function <code>identify_language()</code> can be used to find out.
includeNA	Logical if NA (No answer) data should be included

**Value**

A dataframe with the columns ROOT\_ID, LATITUDE, LONGITUDE and all the available categories per defined property. Besides the percentage of categories per site, the number of observations is given.

---

create\_legend\_labels *Adds additional information to legend values*

---

**Description**

Adds additional information to legend values

**Usage**

```
create_legend_labels(
  lv,
  low_label = NULL,
  high_label = NULL,
  increase_bounds = TRUE
)
```

**Arguments**

lv	legend values as returned by <code>indicators_to_colors()</code> in the legend_table
low_label	Additional label for the lowest value
high_label	Additional label for the highest value
increase_bounds	Add greater or equal / less or equal than sign to the highest /lowest legend value

**Value**

extended legend labels

---

`get_LakeIndicators`      *Calculate all indicators for all recorded lakes*

---

**Description**

Calculate all indicators for all recorded lakes

**Usage**

```
get_LakeIndicators(df_cw)
```

**Arguments**

`df_cw`              Dataframe of the crowdwater lake properties prepared by [prepare\\_data\(\)](#)

**Value**

A dataframe that contains columns of the root id, coordinates, the indicator values and number of observations as well as the date of the most recent observation

---

`identify_language`      *Function identifies the language based on category names*

---

**Description**

Function identifies the language based on category names

**Usage**

```
identify_language(df_cw)
```

**Arguments**

`df_cw`              Dataframe of the crowdwater lake properties prepared by [prepare\\_data\(\)](#)

**Value**

A character string of the language

---

indicator\_biotope      *Calculation of the CrowdWater Biotope Indicator*

---

**Description**

The indicator is calculated per observation

**Usage**

```
indicator_biotope(df_cw, return_scoring_system = FALSE)
```

**Arguments**

df\_cw                  Dataframe of the crowdwater lake properties prepared by [prepare\\_data\(\)](#)  
return\_scoring\_system  
                          If TRUE the scoring system is returned instead of the indicator vector.

**Value**

Either a numeric vector of the indicator points, or a description of the scoring system. This is a list of properties and categories which contribute to the indicator.

---

indicator\_nutrients      *Calculation of the CrowdWater Nutrient Indicator*

---

**Description**

The indicator is calculated per observation

**Usage**

```
indicator_nutrients(df_cw, return_scoring_system = FALSE)
```

**Arguments**

df\_cw                  Dataframe of the prepared crowdwater data  
return\_scoring\_system  
                          If TRUE the scoring system is returned instead of the indicator vector.

**Value**

Either a numeric vector of the indicator points, or a description of the scoring system. This is a list of properties and categories which contribute to the indicator.

---

indicator_usage	<i>Calculation of the CrowdWater Usage Indicator</i>
-----------------	--

---

**Description**

The indicator is calculated per observation

**Usage**

```
indicator_usage(df_cw, return_scoring_system = FALSE)
```

**Arguments**

`df_cw` Dataframe of the crowdwater lake properties prepared by [prepare\\_data\(\)](#)  
`return_scoring_system`  
If TRUE the scoring system is returned instead of the indicator vector.

**Value**

Either a numeric vector of the indicator points, or a description of the scoring system. This is a list of properties and categories which contribute to the indicator.

---

indicator_waterStress	<i>Calculation of the CrowdWater Biotope Indicator</i>
-----------------------	--

---

**Description**

The indicator is calculated per observation

**Usage**

```
indicator_waterStress(df_cw, return_scoring_system = FALSE)
```

**Arguments**

`df_cw` Dataframe of the crowdwater lake properties prepared by [prepare\\_data\(\)](#)  
`return_scoring_system`  
If TRUE the scoring system is returned instead of the indicator vector.

**Details**

While most citizens are not able to tell if the lake experiences water stress by the observation at one point of time, there might be citizens who know the water body for a long time. The more observations include this information the more certain it is. Some citizen may only know about water level changes but cannot answer if the lake dries out. This is why in contrast to the other indicators, the points are counted even if one question remains unknown or unanswered.

**Value**

Either a numeric vector of the indicator points, or a description of the scoring system. This is a list of properties and categories which contribute to the indicator.

---

indicators\_to\_colors    *Transformation of numeric values into colors*

---

**Description**

Transformation of numeric values into colors

**Usage**

```
indicators_to_colors(
  v_indicator,
  v_worst,
  v_neutral,
  v_best,
  col_worst = "#E6550D",
  col_neutral = "#EFF3FB",
  col_best = "#08306B",
  col_NA = "#00000000",
  resolution_bad = 0.1,
  resolution_good = 0.1,
  resolution_legend = 1
)
```

**Arguments**

v_indicator	Numeric Vector of indicator data
v_worst	Worst possible value
v_neutral	Neutral value
v_best	Best possible value
col_worst	Color for worst value as hexadecimal string of the form "#rrggbb"
col_neutral	Color for worst value as hexadecimal string of the form "#rrggbb"
col_best	Color for worst value as hexadecimal string of the form "#rrggbb"
col_NA	Color for NA values (Transparent by default)
resolution_bad	the resolution between neutral and worst value
resolution_good	The resolution between netral and best value
resolution_legend	The resolution of the legend values

**Value**

Vector of colors corresponding to the indicator values

---

lake_indicator	<i>From single observation to average site indicators</i>
----------------	---

---

**Description**

From single observation to average site indicators

**Usage**

```
lake_indicator(df_cw, indicator_type)
```

**Arguments**

`df_cw` Dataframe of the crowdwater lake properties prepared by [prepare\\_data\(\)](#)  
`indicator_type` A character defining the indicator. Either "nutrients" "biotope", "usage" or "waterstress"

**Value**

A data frame of 5 columns (ROOT\_ID, LATITUDE, LONGITUDE and the indicator value and the number of observations)

---

latest_observations	<i>Returns only the latest observations per lake</i>
---------------------	--

---

**Description**

Returns only the latest observations per lake

**Usage**

```
latest_observations(df_cw)
```

**Arguments**

`df_cw` Dataframe of the crowdwater lake properties prepared by [prepare\\_data\(\)](#)

**Value**

A dataframe in the same shape as the lake properties dataframe with all historical observations removed

---

leaflet_indicator	<i>Create an interactive leaflet map which contains all the information of the last observation</i>
-------------------	---

---

**Description**

The leaflet map has two layers. 1) all the observed properties 2) the corresponding image of that observation

**Usage**

```
leaflet_indicator(cw_indicators, language = "german")
```

**Arguments**

cw_indicators	Dataframe of the crowdwater indicators per lake created by <a href="#">get_LakeIndicators()</a>
language	A character string, defining the language if the map

**Value**

A leaflet map

---

leaflet_last_observation_days	<i>Create an interactive leaflet map which contains the days passed since the last observations</i>
-------------------------------	---

---

**Description**

Create an interactive leaflet map which contains the days passed since the last observations

**Usage**

```
leaflet_last_observation_days(df_cw, language = "german")
```

**Arguments**

df_cw	Dataframe of the crowdwater lake properties prepared by <a href="#">prepare_data()</a>
language	A character string, defining the language if the map

**Value**

A leaflet map

---

`leaflet_last_observation_info`

*Create an interactive leaflet map which contains all the information of the last observation*

---

**Description**

The leaflet map has two layers. 1) all the observed properties 2) the corresponding image of that observation

**Usage**

```
leaflet_last_observation_info(df_cw, language = "german")
```

**Arguments**

<code>df_cw</code>	Dataframe of the crowdwater lake properties prepared by <a href="#">prepare_data()</a>
<code>language</code>	A character string, defining the language if the map

**Value**

A leaflet map

---

`merge_LakeIndicators` *Merge two lake indicator tables*

---

**Description**

Merge two lake indicator tables

**Usage**

```
merge_LakeIndicators(x, y)
```

**Arguments**

<code>x</code>	indicator table created by <a href="#">lake_indicator()</a>
<code>y</code>	indicator table created by <a href="#">lake_indicator()</a>

**Value**

merged table

---

prepare\_data                      *CrowdWater lake data preparation*

---

### Description

The downloaded csv file is filtered for lake specific columns, for regions and for validated observations. The observed properties are named correctly in English.

### Usage

```
prepare_data(path, file, region = NULL, validated_only = TRUE)
```

### Arguments

path                      The filepath

file                      The filename including the ".csv" ending

region                    Either a character defining a region which is available in or a numeric vector of coordinates in WGS84 shaping a rectangle by "top", "bottom", "left" and "right" coordinate.

validated\_only          Logical if only checked observations are selected

### Value

A list of two data frames. The first one contains data on the observed properties, the second data frame contains data of the physiscale category.

---

props\_and\_cats                      *List of CrowdWater Properties and Categories*

---

### Description

List of CrowdWater Properties and Categories

### Usage

```
props_and_cats
```

### Format

A named list where list names correspond to the crowdwater properties (column names of the table). For each property a data frame of categories is given, which includes the translation into German or English, the order of categories if applicable (if not -> NA) and the type of answers

---

renameMultipleChoice *Replaces multiple separated category names by new names*

---

**Description**

Multiple choice answers per observation are combined a one cell of the table and seperated by a comma.

**Usage**

```
renameMultipleChoice(v, oldNames, newNames, sep = ", ")
```

**Arguments**

v	Character vector of categories
oldNames	Character vector listing the old names of the categories
newNames	Characteri vector listing the new names of the categories in the same order as the oldNames vector
sep	The seperator that is used in a cell between categories of the same observation

**Value**

Character vector of renamed categories

---

renameSingleChoice *Replaces multiple category names by new names*

---

**Description**

Replaces multiple category names by new names

**Usage**

```
renameSingleChoice(v, oldNames, newNames)
```

**Arguments**

v	Character vector of categories
oldNames	Character vector listing the old names of the categories
newNames	Characteri vector listing the new names of the categories in the same order as the oldNames vector

**Value**

Character vector of renamed categories

---

save_leaflet	<i>Save a leaflet as html</i>
--------------	-------------------------------

---

**Description**

By adding content to the html it is assured that icons are scaled according to the device. In this way the map can be used by mobile devices.

**Usage**

```
save_leaflet(x, file)
```

**Arguments**

x	Leaflet object to be saved
file	Filename including path

---

site_category_percentage	<i>Returns only the latest observations per lake</i>
--------------------------	--

---

**Description**

Returns only the latest observations per lake

**Usage**

```
site_category_percentage(df_cw, includeNA = FALSE)
```

**Arguments**

df_cw	Dataframe of the crowdwater lake properties prepared by <a href="#">prepare_data()</a>
includeNA	Logical if NA (No answer) data should be included

**Value**

A dataframe in the same shape as the lake properties dataframe with all historical observations removed

---

translate\_categories *From single observation to average site indicators*

---

**Description**

From single observation to average site indicators

**Usage**

```
translate_categories(df_cw, from, to)
```

**Arguments**

df_cw	Dataframe of the crowdwater lake properties prepared by <a href="#">prepare_data()</a>
from	Character string, defining the language of df_cw
to	Character string, defining the language to translate in

**Value**

df\_cw translated
